Mesenchymal stromal cell-mediated induction of fibrosis in 3D collagen cultures. Mesenchymal stromal cells (MSCs) are multipotent and plastic cells with therapeutic potential. To characterize the ability of MSCs to promote fibrosis in 3D culture, we developed a three-dimensional, collagen-based assay to test the effects of MSCs on dermal fibroblasts. MSCs were isolated from the bone marrow of green fluorescent protein transgenic mice and treated with 10 ng/mL transforming growth factor beta (TGF- β) to determine whether enhanced expression of the pro-fibrotic genes, connective tissue growth factor (CTGF) and α -smooth muscle actin (α -SMA), could be detected in the absence of exogenous pro-fibrotic growth factors. Cells were cultured in collagen gels that incorporated fibroblasts and treated with MSCs alone or in the presence of TGF- β for seven days. In addition to a significant increase
