## Intel Visual Fortran Windows 7 64 Bit Download LINK

Provides the graphics workbench tools (Visual Fortran Composer, Visual F90) for Intel® Windows®. The invention relates to a container for containing and transporting eggs which is capable of being displayed when not in use and is collapsible, when in use, into a folded and stacked condition for storage. Known egg containers for the retail food trade are typically made from thermoplastics materials and have a rectangular shape with rounded corners. They are not suitable for the retail food trade when displaying the eggs. Because the eggs are packaged at a predetermined time before shipping, the carton is not visible during a normal retail shopping trip. This limits the consumers' market to those who do not wish to purchase eggs at the time of year when eggs are in season. Alternatively, retailers may advertise and promote the availability of eggs at a particular time of year. This advertising and promotion usually takes the form of windows or other displays at the entrance to the store. It is expensive, and may limit the shoppers' market because the shoppers who are interested in eggs usually only shop once a month. Known egg containers are for closed storage of a predetermined quantity of eggs. These containers are usually marked with a code to aid in the sale of eggs to a wholesale house. A principal object of the invention is to provide a container for transporting and storing eggs which is collapsible into a folded and stacked condition for storage, which maintains an attractive display when it is not in use and can be displayed as required. In one aspect of the invention there is provided a container comprising (a) a body having a front end, a rear end, first and second side ends, and a bottom wall; (b) a transverse fold line running through a midpoint on the first side end between the front and second side ends, extending from the bottom wall to the first side end, and dividing the container into first and second adjacent body portions; and (c) a transparent lid hinged to the front end of the first adjacent body portion and moveable between an open position, in which the lid is located above the fold line, and a closed position in which the lid lies flush with the body first adjacent body portion and in which the body is folded in half, transversely along the fold line. The lid is preferably hinged to the container body by means of a hinge connection so that the lid is able to pivot up and down over the front end of the container body. The midpoint of the first side
