Field of the Invention The present invention relates to a liquid crystal display (LCD) device including a transverse electric field system and a method of manufacturing the same. More particularly, the present invention relates to an in-plane switching (IPS) mode LCD device including an electrode pattern in which a plurality of protruded electrodes and an interconnection line overlap each other, and a method of manufacturing the same. 2. Description of the Related Art In general, the LCD device includes a lower substrate (or a thin film transistor (TFT) substrate) on which a plurality of gate and data lines crossing each other are formed, a lower electrode formed to cross the gate and data lines, an upper substrate (or a color filter substrate) facing the lower substrate, and a liquid crystal layer disposed between the lower and upper substrates. Further, the thin film transistor (TFT) is formed at a position that corresponds to a crossing portion between the gate and data lines. The gate lines are connected to a gate driver (not shown) to apply a gate signal to each of the gate lines, and the data lines are connected to a data driver (not shown) to apply a data signal to each of the data lines. The lower substrate and the upper substrate are attached to each other by a seal pattern. The TFT is formed to include a semiconductor layer, a gate electrode, a gate insulating layer, a source electrode and a drain electrode. The source and drain electrodes face each other with the gate insulating layer therebetween in a channel portion of the semiconductor layer. Generally, the liquid crystal display device is classified into a vertical electric field system and a transverse electric field system according to the direction of electric field that is applied to the liquid crystal layer. In the vertical electric field system, a common electrode is formed on the lower substrate and a pixel electrode is formed on the upper substrate. The 6d1f23a050
