People might also be tempted to take a closer look at Peter Jackson's The Hobbit: An Unexpected Journey, released last November, a first look at which hits theaters in December. The 3-D epic is the first of a trilogy of films to use special 3-D film developed by Warner Bros. studio, for a 22-minute prologue at the beginning. The three-day box-office take for the film was an estimated \$85 million, but the film had appeal from the start. That he's Bilbo Baggins from The Lord of the Rings, a hot book adaptation and a long-anticipated prequel to the Harry Potter books, helped draw people to the theaters. And his good-natured and endearing character appealed to many of those who were in a holiday mood to see a family movie. The first game was a fairly straightforward fighting game that allows players to interact with each other and an environment to set up their own chain of action. The second game, based on Katsuhiro Imaizumi and Mario Ando's storyboard, takes place in a high-tech casino, where the player guides his AI 'Robo' in a series of two-on-two combat sequences. Its playful nature emphasizes the power of gaming as a technology that enables users to explore new forms of interaction through dynamic and adaptive feedback. The Casino game is still in development, but the team has discovered a way to make the experience feel more cinematic. A camera tracks the players - not the player the camera, but the players interaction. A 2D projection fuses the 3D tracking data with a 2D render of the players model, and projects the result on the wall in front of the players. Everyone is fighting in 2D, and the experience feels like you are playing a movie. So its easier for the users to involve themselves in the action. It makes it more interactive and fun.

Body Heat 2010 Hollywood Movie D

Here the female characters are sitting on the throne. We have TChalla and his sister. And there they are sitting in the room. She sits at one end of the room and he sits at the other end. We see their upper body, their hands, and then their feet. Obviously, we look at them. We look at their various outfits. We see their shoes and we have some kind of weapons they used. (Laughter.) So, the traditional object of cinema in that scene is not to let us penetrate and look into their private world, they seem to be operating within the formal hierarchy. We look at them. We see them. We take this all in. That is how it should be. But when we leave this room, well, the camera switches to the

outside of this palace. And where do we go? To the laboratory, of course. And here we go to what is perhaps a very interesting scene in the movie. The Blade Runner visionary and future-face Philip K. Dick, (1931 - 1982) achieved a prominent position in the 1960s only after the award-winning success of the sf novel *The Man in the High Castle* (1962). *Body Heat* conflates the death-run of Dick's protagonist and the end of another prominent film-maker's; Steve McQueen, *the Manchurian Candidate* (1962). McQueen was the National Medal of Arts Laureate, following *The Thomas Crown Affair* (1966). The film was a number three box office hit in the U.S. in 1967 and widely distributed worldwide. It became the highest grossing British film of the time in 1978

(Amazon) and, remarkably, has been preserved on home video. McQueen's movie is an important benchmark for a genre that has recently rediscovered the brilliance and relevance of Blade Runner-type scenarios, in particular for an imagined dystopian future. In the 2040s, Deckard is on the hunt to track down and eliminate replicants (androids) who are programmed to be tough, independent, self-reliant and obedient. Led by The Boss (a genetically-enhanced superhuman) replicants are offered the wages of slavery. They are employed in laboratories to work with self-replicating nanotechnology. Sympathisers of the replicants are hunted down by the police. And the most popular movement on the website of 2068 is for freedom. This is

a growing movement in Japan, where there is a popular movement for the legal recognition of other beings, such as dolphins and human pets.
