flissinneple [url= Non-thymic T cells participate in the development of epidermal Langerhans cells. The establishment of epidermal Langerhans cell (LC) lineages after in utero exposure to the allogeneic maternal leukocytes, and the development of epidermal LC at skin sites expressing the major H-2 antigen class I Kb E alpha beta TCR (K12) Id2-/- mice are significantly disturbed. Here, we investigate the interplay between the thymus and skin LC development by comparing LC populations in thymectomized (Tx) and intact H-2b K12 Id2-/- mice. LC lineage development in the absence of thymic selection was found to be still partially dependent on non-thymic T cells which display a natural autoimmune phenotype. This involved a fetal epithelium inducing CD8alpha2+

---

dendritic epidermal T cells that contact and persist in the skin, these cells being mostly CD8alpha-CD4-CD3-B220-.

Additionally, skin LC development was significantly reduced in Tx-H-2b K12 Id2-/- mice and the surviving epidermal LC were shown to be functionally abnormal. This observation is explained by the presence of non-thymic cells with autoreactive properties within the skin-associated lymphoid tissues, which may participate in the development of LC.
