

The Management Scientist Version 5.0 ((BETTER)) Download

[Download](#)

EPAs Positive Matrix Factorization (PMF) Model is a mathematical receptor model developed by EPA scientists that provides scientific support for the development and review of air and water quality standards, exposure research and environmental forensics. The PMF model can analyze a wide range of environmental sample data: sediments, wet deposition, surface water, ambient air, and indoor air. EPAs PMF model reduces the large number of variables in complex analytical data sets to combinations of species called source types and source contributions. The source types are identified by comparing them to measured profiles. Source contributions are used to determine how much each source contributed to a sample. In addition, EPA PMF provides robust uncertainty estimates and diagnostics. PMF Model software uses graphical user interfaces that ease data input, visualization of model diagnostics, and exporting of results. The model is free of charge and does not require a license or other software to use. Algorithms used in the PMF model have been peer reviewed by leading air and water quality management scientists. Developed to address an existing need for foundational teaching in statistics in the context of real data analysis, the Real Data Analysis Tools (RDA Tools) is a set of downloadable statistical analysis software packages. The RDA Tools have been designed to serve as teaching aids, tools and services for course and program development. DSAS version 5.0 was released in July 2020 and is publicly available here. Click on the file DSASAddin_v5.0.zip to download the Esri add-in file. The supporting DSAS version 5.0 User Guide (found here) contains installation procedures, system requirements, and detailed instructions for use. Available help resources include an instructional video for System Requirements and Installation, as well as a tutorial detailing a Sample Data Workflow. For additional questions please contact DSAS_help@usgs.gov
