A major new feature of Lightroom 6.0 is support for the RAW files from the Fujifilm X-T2 and X-H1. There have been minor improvements to other features in Lightroom 5, including loading from a storage card. There's also a new "quick view" tool that makes it easier to crop photos and apply other editing effects. The company has rolled out Lightroom 6 as a free update, and there is also public beta support for Street View images and other improvements. For those folks who have a lot of digital images stored on their computer, the new version 6 makes it easy to select photos to copy to a new folder and then easily rename the photos. The new version also works faster. It uses the preview window to show which part of the image is covered up when you're editing. Under Preferences, you can specify whether you want to see or hide it. Elements isn't an image editor, although it can be used to enhance photos. But more-and-more, Elements is being used as a simple image browser and importer. There's a new "Edit in Place" function that lets you make changes to an image and export it as a new file without exporting to a new location first. Such functions were always possible in Lightroom, but so far hasn't been possible in Elements. You can also associate a search term with a folder of images all at once. In the new version, there's a version called "Basic Edits" that some sides may feel is a handy tool for getting flatness on architectural shots—a sort of one-stop shop for basic flattening operations that is difficult to perform with much precision, either by eye or using RAW adjustment sliders. We haven't tested enough photos to say if this functions as promised, but it certainly seems worthwhile. There's a "Quick Crop" tool that crops photos straight

to the final size you want. You can even set up different profiles.

Another exciting update you can expect is support for Dynamic Linking. Most people using elements have found the ability to quickly share elements from anywhere will greatly benefit their workflow. Usually, the design process is a long one, with you spending time creating the sketch and plan, before putting it in front of the client, and then editing it again before closing a project. The updated features of the flagship Photoshop app are powered by Adobe Sensei, the Image

Intelligence engine powered by machine learning that will soon be available for all of Adobe's creative applications. New technologies in Photoshop have the power to transform the way users create, communicate, work digitally and connect with the world. • "Actions" enable the creation of one-click replacements or deletion in any image using a single action. These features will be available in the first half of 2019 for Photoshop and Lightroom customers. The Photoshop team also introduced two new features powered by Adobe Sensei. "Select by Color" is a feature that advances the user interface and teaching of "color selection" in Photoshop, making complex and advanced color selections as simple as creating a hue selection. The other feature, Navigate by Color, leverages the new processing power of AI to teach the user how to navigate through images based on color. Navigate by Color enables the user to identify and adjust objects in images based on colors in the images. Adobe introduced Navigate by Color, which allows users to identify objects in an image based on color, by using an animation created from the color data. Users can see how Photoshop learns different colors and gestures based on the image, rather than relying on the user to teach it. The team also announced multi-threading and GPU support for compositing, a technology Adobe developed in partnership with Imaginary Forces that dramatically improves the performance of Photoshop's multi-threading-based compositing capabilities, and enables better, more accurate out-of-core processing for faster rendering.
