If you are having a problem installing Photoshop or cracking the software, then you may be better off downgrading the software. First, get the latest version of Adobe Photoshop. Then, download the file that notifies you of version updates. After that, run the file and open Photoshop. If the software is not activated, then you should be able to upgrade the software to the latest version. To do this, you need to locate the file called Photoshop.wmf and save it to your desktop. Then, open Photoshop. If the software is not activated, you should be able to upgrade the software. If not, then you need to search around the Internet and try to locate a valid serial number. Once you have done that, activate it and enjoy using Photoshop!

It's nice to see you take the time to explain XML for beginners and even warn about further information the user might need to go through to make the file compatible (and why the warning is needed). Good job! There is a lot more I would like to see in your review. For example there is no mention of cross-system performance. I assume you're using Windows, so that's not an issue you were testing. (Similarly, cross-platform performance is not acceptable to me.) I have a couple of OS X laptops and a Nexus 6. If I open a RAW file that was created and saved on another OS, it will happily read that file in HSV color space just fine in the other OS - but I have to do a profiling operation to allow LR to "import" the data. Even more bizarre, when I save a PSD from the other OS, it loses all the plugins I had installed. (Saving as JPEG works OK.) Hi Andrew, the program works great, but I also want to ask about the purpose of your on-line review. Would there be any benefit to you (or the rest of the Adobe Photoshop Team) to post your thoughts on your own web site? Were you just trying to make an example of this reviewer, in order to have paid-for advertising? In addition, perhaps you could use this web site to announce future reviews, and to post reviews that you are doing. (You could even advertise your paid-for reviews on this web site). In your earlier reviews, you've mentioned that the Organizer interface is more basic: this is incorrect. You can revert your current image set to a previous version with the Organizer's History feature. And this is a great way to compliment a current image and compare it to the previous versions with the exact same adjustments. However, you cannot compare the same image with different settings. There is no real-time adjustment feedback in the Organizer's interface, so why give an opportunity for back-and-forth with a reviewer? You can compare the same image set over time, but this could only be a snapshot of an image set that you are planning to finish using your time right there and then. What's more, I found time intervals to be inconvenient. There are no presets available on the Organizer, so you have to adjust the time intervals for a review manually if you want to offer an in-context setup before time starts ticking. It is possible to do this, but it is a hassle, unless you have an absolute need for in-stance reviews. And a major drawback is that you have to re-adjust the previously used settings in order to apply other ones. That should not be too hard to do, as long as you don't have to do it too often.
